

1 **ABSTRACT**

2       The described subject matter automatically detects the boundaries of  
3 multiple objects in digital image data such as scanned image data. To accomplish  
4 this, a background color such as a scanner lid background color is detected. An  
5 edge map is generated based on a set of transitions between the determined  
6 background color and other colors that correspond to the scanned image data. A  
7 set of straight lines, or boundaries that correspond to one or more objects in the  
8 image data is determined by analyzing the generated edge map. The straight lines  
9 are assigned to respective objects based on a set of rules.
